Freshtastic - Redefining Produce Inspection

Here is where **your produce inspection begins**

01 Motivations

Why we did this project

02 Problem definition

What is our problem

03 Technical aspects

How we solved the problem

04 Ethics

What are the ethical implications

05 Market

What are the market applications

01

Motivations

17%

of **food wasted** at the consumer level

127kg

of **food wasted annually** in the EU per inhabitant

9 Billion €

of **wasted food value** in Italy

“Imagine walking out of a grocery store with four bags of groceries, dropping one in the parking lot, and just not bothering to pick it up. That’s essentially what we’re doing.”

—Dana Gunders, Food & Agriculture Scientist

02

Problem Definition

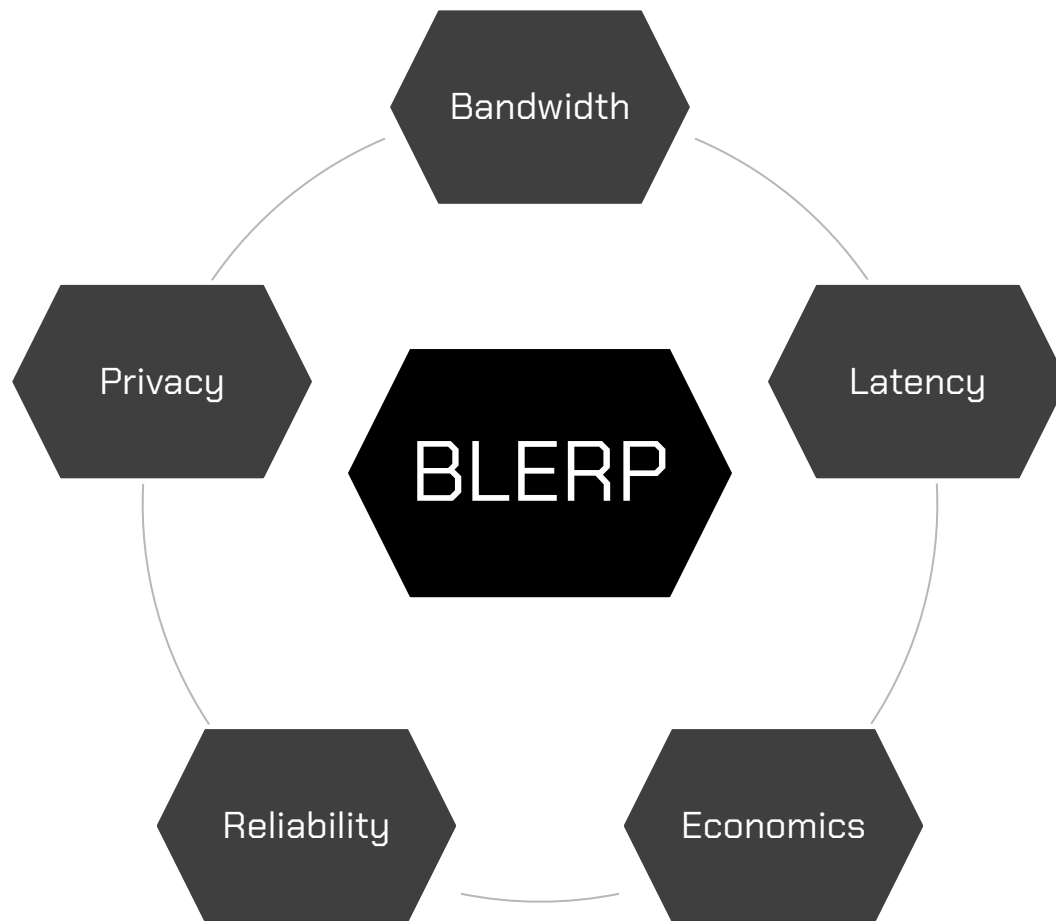

What is our problem

We want to create a computer vision algorithm to classify fresh and rotten produce

- Built for tiny devices
- Reliable and fast
- Ethical and Marketable

And the most important thing: the tool has to work!

03

Technical aspects

How we solved the problem

The first challenge is to define a tiny model that fits our technological constraints while keeping accuracy in mind. Our solution is to build a scalable model.

- Custom Separable convolution blocks
- Tuning hyperparameters

jojo_n4_r96x96_α0.7_β5_g2.2_strides2

Initial strides
→ Channel gain
→ Depth Multiplier
→ Width Multiplier
→ Resolution
→ N. of classes
→ Model structure

Block structure

$$C_i = \alpha \cdot C_{start} \cdot (i \cdot g)$$

The second challenge is to find enough relevant data to train and test our model. We managed to get a total of around 5000 images from:

Source 1 ($\approx 80\%$): Spoiled and fresh fruit inspection dataset

Source 2 ($\approx 10\%$): Personal photos in various supermarkets (Milan, Messina, Macerata, Genova)

Source 3 ($\approx 10\%$): Image scraping under Creative Common License.

Number of parameters	Max consecutive Activations (kB)	MACs (M)	# layers
29605	39.744	1.38	23

On-device performance

Arduino Nano 33 BLE ...

PROCESSING TIME
240 ms.

RAM USAGE
66,1K

FLASH USAGE
83,2K

Results

ACCURACY

91.49%

	F_BANANA	F_TOMATO	S_BANANA	S_TOMATO	UNCERTAIN
F_BANANA	93.2%	0.6%	3.7%	0%	2.5%
F_TOMATO	0%	87.8%	0%	6.8%	5.4%
S_BANANA	0%	0%	99.3%	0.7%	0%
S_TOMATO	0%	9.5%	0.9%	84.5%	5.2%
F1 SCORE	0.96	0.90	0.97	0.87	

→ Y-axis: Predicted labels

→ X-axis: True labels

04

Ethics

Increasing Criticality

Food Waste & Safety

Environmental
conservation and
sustainability

Data Ownership & Security

Safe and ethical
handling of data

Workplace Surveillance & Job Displacement

Awareness and consideration of
the impact of AI on the
workforce

Reduction of food loss

$$FPR = \frac{FP}{FP + TN} = \frac{16}{16 + 279} \approx 5,4\%$$

	F_BANANA	F_TOMATO	S_BANANA	S_TOMATO	UNCERTAIN

Privacy-oriented offline processing 

Conscious development

05

Market

Three Stakeholders

Private Users

Aiding people in
making more
healthy and
cost-effective
decisions

Retail

Empowering the
retail sector with
a **reliable tool** to
handle their
inventory

Industry

Streamlining the
food sorting and
grading process

Shop consciously and save money

Our model can be used to guide
purchasing decisions to **minimize**
spending and food waste.

Reliable & fast inspections

With our device retail centers can
quickly inspect deliveries and
shelf items in a reliable way,
improving inventory management and
customer satisfaction.

Streamlining processes

A fast and easily maintainable
edge device that **reduces sorting
time.**

Federated Learning Approach

The **biggest** question

Does it work?
